**MINIMIZE THE
DAMAGING EFFECTS OF
ORAL BACTERIA TOXINS**

Denta KOTE™

Effectively Taking a Bite Out of Dental Disease

An advanced biopolymer that bonds instantly

Streptococcus mutans and other bacteria associated with tooth decay establish colonies that lead to the formation of the biofilm known as plaque. The bacteria digest sugar, producing acids that attack enamel and eventually lead to tooth decay.

DentaKote is used to block this bacteria from teeth, especially the backside, from developing damage or decay. It is clear, odorless, colorless, and provides a non-stick surface against all oral bacteria and debris.

Reapplication of this safe, effortless application is recommended at your patient's subsequent recall visits.

Developed by a dentist, **DentaKote** is an advanced biopolymer gel that bonds instantly to hard surfaces in the oral cavity and dental appliances. It is applied by a hygienist or dentist intraorally and labs can apply it to all their prosthesis before delivery. It conveniently comes in a preloaded brush with enough sealant to easily cover both upper and lower arches. It bonds instantly and is only one micron thick.
